

FAIR WEATHER STRATEGIES BOND YIELD STRATEGY

QUARTERLY FACT SHEET | 3Q 2024

OBJECTIVES

Fair Weather Strategies' Bond Yield strategy seeks to provide investment returns that generally meet or exceed the price and yield performance, before expenses and fees of the Barclays U.S. Aggregate Bond Index.

The strategy focuses on higher yielding sub-sectors of the fixed income asset class.

The strategy can at times invest in both domestic and international bonds.

STRATEGY

- One-stop, cost-effective exposure to a relatively broad fixed income portfolio.
- Exposure to large, liquid exchange traded funds (ETFs).
- Separate accounts with daily liquidity and no lock-up periods.

INVESTMENT APPROACH

This strategy takes positions in a variety of sub-asset classes within the fixed income asset class. The emphasis is on locating higher yielding bond exposure while staying diversified within the asset class. Vehicles utilized to gain exposure to these asset classes are primarily Exchange Traded Funds (ETFs). The strategy takes a passive investment approach, aims to be almost fully invested at all times and will be re-balanced infrequently.

STRATEGY CHARACTERISTICS

Structure:	Separate Accounts
Inception Date:	September 1st, 2023
As of Date:	September 30th, 2024
Assets:	\$0.5mn

CHARACTERISTICS †

FAIR WEATHER STRATEGIES BOND YIELD STRATEGY

QUARTERLY FACT SHEET | 3Q 2024

DISCLOSURES

Performance Calculation

Performance results and strategy characteristics are derived from the strategy's composite. The composite includes all fee-paying, discretionary accounts currently or previously managed in accordance with the strategy, including those that are no longer with the firm. There is no account minimum for the composite.

Inception date of the composite presented is October 1st 2015. Accounts are included in each strategy's composite after the first full month of performance to the present or until the end of the last full month before the cessation of the client relationship with Fair Weather Strategies.

The returns of the individual portfolios within the composite are time-weighted, use trade date accounting, and are based upon monthly portfolio valuations. The composite returns are asset-weighted based upon beginning period market values.

The composite may contain both taxable and nontaxable accounts. Performance results are presented in U.S. dollars and are net-of-max fees and trading expenses. The applicable fee schedule is 1.0%, the highest rate Fair Weather Strategies currently charges separate account clients. Actual fees may vary based on, among other factors, account size and firm's relationship with the client. Results are presented before taxes. All realized and unrealized capital gains and losses as well as all dividends and interest from investments and cash balances are included.

Monthly geometric linking of performance results is used to calculate quarterly and annual returns.

The investment results shown are not necessarily representative of an individually managed account's rate of return, and differences can occur due to factors such as the timing of initial investment, client restrictions, cash movement, etc. Securities used to implement the strategies can differ based on account size, custodian, and other factors. To receive a complete list and description of Fair Weather Strategies, LLC's composites and a copy of the firm's performance calculation policy, please contact the firm at the address listed below.

Risks

Past performance is no guarantee of future results. There are risks associated with any investment strategy, including the possible loss of principal. Diversification strategies do not ensure a profit and do not protect against losses in declining markets. There is no guarantee that any investment strategy will achieve its objectives. Fair Weather Strategies' reliance on the strategy and its judgments about the value and potential appreciation of the securities in which the strategy invests may prove to be incorrect.

Overall market risk, including volatility, may affect the strategy's performance. Fair Weather Strategies' risk-management process includes an effort to monitor and manage risk, but should not be confused with and does not imply low risk or the ability to control risk.

The strategy invests primarily in Exchange Traded Funds (ETFs). ETFs are subject to market risk, including the possible loss of principal. The value of the ETF will fluctuate with the value of the underlying securities. The strategy is subject to risks associated with its underlying ETFs. ETFs trade like a stock and there will be brokerage commissions associated with buying and selling exchange traded funds. ETFs may trade for less than their net asset value. The strategy may invest in underlying ETFs that utilize alternative or non-traditional investments strategies, including but not limited to volatility strategies. International investments may involve additional risks, which could include differences in financial accounting standards, currency fluctuations, political instability, foreign taxes and regulations, and the potential for illiquid markets. Investing in emerging markets may accentuate these risks.

Benchmarks

The Barclays U.S. Aggregate Bond Index is an index of U.S. investment-grade government and corporate bonds. The total return on a portfolio of investments takes into account not only the capital appreciation on the portfolio, but also the income received on the portfolio. Index performance does not reflect the deduction of fees or transactions costs, which would decrease performance.

The benchmark listed above has not been selected to represent an appropriate benchmark with which to compare an investor's performance, but rather is disclosed to allow for comparison of the investor's performance to that of certain well-known and widely recognized indexes. The index above is not the only indices used as a benchmark for measuring the performance of a portfolio. Depending on an individual investor's investment objectives and risk temperament, it may be appropriate to measure performance against a different benchmark.

Performance of each Fair Weather strategy relative to its respective performance benchmark may have been impacted positively or negatively by economic and market conditions which affect either the benchmark or the Fair Weather strategy to a greater degree.

A reference to an index or benchmark does not imply that the Fair Weather strategy will achieve returns, experience volatility, or other results similar to the index. The composition of a benchmark index may not reflect the manner in which a Fair Weather strategy is constructed in relation to expected or achieved returns, investment holdings, asset allocation guidelines, restrictions, sectors, correlations, concentrations, volatility, or tracking error targets, all of which are subject to change over time. You cannot invest directly in an index.

Definitions

Risk measures are calculated using month end values. Standard Deviation measures the dispersion of returns; a large dispersion shows higher volatility. Beta is a measure of the volatility, or systematic risk, of the composite portfolio in comparison to its benchmark. Maximum drawdown is the maximum observed loss from a peak to a trough of a portfolio, before a new peak is attained - we measure it here only by comparing month end aggregate portfolio values. Upside capture ratio is calculated by dividing the cumulative return of the strategy during months the index is up or flat by the cumulative return of the market during the same periods. Downside capture ratio is calculated by dividing the cumulative return of the strategy during months the index is down by the cumulative return of the market during the same periods.

Fair Weather Investing is a servicemark of Fair Weather Strategies, LLC.

This communication does not constitute an offer to sell or solicitation to purchase any security.
